TITLE: On the Evaluation of the Aerodynamic Properties Of Connecting Nozzles for Turbine-type Machinery (K voprosu otsenki aerodinamicheskogo kachestva patrubkov turbomashin)

PERIODICAL: Sb. tr. In-t teploenerg. AN Ukr SSR, 1956, Nr 13, pp 99-103

ABSTRACT: For the evaluation of the aerodynamic properties of various types of connecting nozzles for the turbine-type machinery, the authors suggest that in lieu of the hydraulic loss coefficients, the coefficient of resistance ζ_r or loss coefficient ζ_l be employed. These coefficients refer to the dynamic head at the inlet, which is calculated on the basis of the resultant velocities, viz.:

$$\zeta_r = 1 + \frac{2\lambda_2 - \chi_2}{n^2 \chi_1} - \frac{2\lambda_1}{n \chi_1}, \quad \zeta_l = 1 + \frac{2\lambda_2}{n^2 \chi_1} - \frac{2\lambda_1}{n \chi_1}$$

Card 1/2 where $\lambda_{1,2}$ and $\chi_{1,2}$ are coefficients characterizing the

TITLE: Losses in Turbine Guide Cascades ²³ |

PERIODICAL: Sb. tr. In-t teploenerg. AS UkrSSR, 1958, No. 14, pp. 167 - 173

TEXT: Results are presented from an experimental study of the dependence of the aerodynamic characteristics of immovable cascades formed by guiding vanes on the geometrical cascade parameters. Cascades were investigated, which were formed by vanes having a relative length $l = 1.7, 1.27, 0.396$, a relative pitch $t = 0.804, 0.7, 0.6$ under the condition of stream incidence angles at the cascade entrance $\alpha_2 = 60^\circ, 90^\circ, 120^\circ$, and the rated stream exit angle $\alpha_1 = 13^\circ$. The known result is obtained that the cascade efficiency and the stream exit angle vary only insignificantly with the stream incidence angle, which is characteristic for a cascade having a high degree of reactivity and a thick inlet edge. For cascade with a relative length $l = 1.7$ the maximum value of the cascade profile efficiency is obtained for $t = 0.804$, $\alpha_2 = 90^\circ$, and amounts to 96%. The efficiency of the duct at the axial entrance amounts to 95% for a cascade with $l = 1.7$, and 94% for a cascade with $l = 0.396$. The end losses in short vanes

Card 1/2

X

Losses in Turbine Guide Cascades

82181
S/124/59/000/011/003/017
A005/A001

amount to 1.5 - 3%, where the lower value relates to the stream incidence angle $\alpha_2 = 60^\circ$, the higher value to $\alpha_2 = 120^\circ$. In the cascade with the vane length $l = 0.396$, no plane flow exists, and the entire duct is filled up by a three-dimensional stream. In regions immediately adjacent to the front wall, a sharp decrease in efficiency occurs.

TITLE: The Characteristics of Small-Height Turbine Cascades

PERIODICAL: Sb. prats' in-t teploenerg. AN UkrSSR, 1959, No.16, pp. 73 - 76
(Ukr., Russ. summary)

TEXT: Results from experimental investigations of cascades of active turbine blade profiles are presented; the blades had a small relative height $l = 0.815$ and 0.208 ; the tests were carried out at Mach number $M = 0.2$ and Reynolds number $R = 1.6 \times 10^5$. The following results are obtained: 1) The flow around short blades is three-dimensional over the entire height of the blade. The efficiency distribution over the height of the blade is extremely non-uniform, which may be caused by the closure of secondary flows. The value of efficiency of such cascades is essentially lower than the efficiency of long blade cascades; for cascades with $l = 0.208$, the minimum efficiency is found in the middle of the blade, for cascades with $l = 0.815$ at a distance of 0.25 of the height of the blade edge. 2) The optimum value of the stream incidence angle in cascades with very short blades shifts into the region of higher values in comparison with

Card 1/2

The Characteristics of Small-Height Turbine Cascades

82128
S/124/60/000/002/003/012

usual cascades. For example, the increase in stream incidence angle from 19° to 40° in a cascade with $l = 0.208$ led to increase in cascade efficiency from 75% to 81%. 3) The optimum value of spacing in cascades with very short blades $l < 0.3$ shifts into the region of lower values. For example, the increase in relative spacing t from 0.6 to 0.755 led to increasing efficiency of the cascade by 2% in a cascade with $l = 0.208$.

building of experimental models. It describes various types of instruments for measuring the parameters of two- and three-dimensional flows, methods of making and calibrating these instruments and also the manufacturing technology of model turbine blades. It describes also the most frequently used stands for investigating turbine blade cascades in stationary conditions and in motion. Candidate of Technical Sciences V. I. Pechuk assisted in the preparation of the first draft of the manuscript. The authors thank Ye. P. Dyban for his valuable remarks. There are 41 references: 39 Soviet, 1 English, and 1 French.

TITLE: Increasing the corrosion resistance of machine parts

SOURCE: Byulleten' tekhniko-ekonomicheskoy informatsii, no. 8, 1966, 23-24

TOPIC TAGS: corrosion resistance, machine building, machine part, check valve, nozzle, teflon

ABSTRACT: The Plastics Laboratory of the Volgograd Scientific Research Institute of Machine-Building Technology in conjunction with the Volgograd Hydrolysis Plant has increased the corrosion resistance of hydrolysis equipment by substituting metal parts with teflon. Bronze and pig iron machine parts exposed to sulfuric acid concentrations from 85 to 0.5% at temperatures from 180 to 200°C and at pressures from 15—20 atm were replaced by teflon parts. Teflon nozzles were installed in 8 hydraulic units in the Volgograd Hydrolysis Plant. These nozzles are similar in design to the bronze, except for strengthening of the joint in the teflon nozzle flange. Also, pig iron check valves which operate at temperatures of 18—35°C in sulfuric

acid concentrations of 74—85% were replaced by teflon valves.¹¹ Teflon check valves and nozzles are easy to manufacture, have higher resistance to aggressive medium, and have completely impermeable linings. Teflon parts can last 20 times longer than metal ones, as well as save considerable manufacturing costs. Orig. art. has: 1 figure. 2

Experiments on the elimination of sulfur by the addition of specular cast iron. A. T. Yermenko. *Lutetiae Dido* 9, No. 3, 41-2 (1938); *Chem. Zentr.* 1938, II, 3148.—The addn. of 30 kg. of specular Fe (with 14% Mn content) to 800 kg. pig Fe reduced the S content in the pig Fe to 0.1%. The S was combined as MnS and went into the slag. The S content of the slag was increased thereby almost sevenfold. When 50 kg. of specular Fe was used to an 800-kg. charge, an increase in the S content of the pig Fe was observed. This was due to an increase in the viscosity of the molten metal with the resulting formation of centers of crystn. by the MnS formed, so that the latter could not go over into the slag. M. G. Moore

Title : The study of the characteristics of the heat transfer process during boiling in pipes.

Orig Pub: V sb. gidrodinamika i teploobmen pri kipenii v kotlakh vysokogo davleniya. [In the symposium: Hydrodynamics and Heat Exchange in boiling in high-pressure boilers.] M., AN SSSR, 1955, 186-205.

Abstract: Results of research conducted in 1949 on installation No 4 at the Kiev branch of the Central Scientific and Research Institute of the Sugar Industry (TsINS) are presented. This research dealt with heat transfer during the boiling in pipes of water (at atmospheric pressure) and sugar solution (at pressures of 0.4-1 kg/cm² and concentrations of 35 to 70 percent), with natural circulation. The experimental apparatus is schematically

Card 1/4

USSR/Fluid Mechanics. Heat Transfer

Abs Jour: Ref Zhur-Mekhanika, No 6, 1957, 6840

Abstract: illustrated and described in detail. The values of the heat flow in the experiments varied from 10,000 to 80,000 kcal/m², and the circulation rate varied from 0 to 0.55 m/sec. Local values of the heat transfer coefficients were measured along the boiling-pipe at 14 intervals, each of which represented about 6 percent of the total length of the pipe (5 meters). A total of 50 runs (700 determinations of the heat transfer coefficient α) was made; the results of 14 of the experimental runs are presented in a table. General evaluations of the changes in the flow characteristics and heat exchange conditions along the pipe are given. Some of the short-comings of the experiments conducted in 1957 on installation No 1 (Tobilevich, N. Yu., Symposium of work of the Kiev branch of the Central Scientific and Research Institute of the Sugar Industry, 1946-1949) are pointed out; these short-comings resulted in a distortion of the nature of the function of the heat transfer coefficient along the pipe.

TITLE: Thermodynamic properties of liquid solutions in the system: Mg-Al

PERIODICAL: Ukrainskiy khimicheskiy zhurnal, v.28, no.4, 1962, 462-466

TEXT: The emf and thermodynamic properties of the system $Mg/KCl - LiCl + 1\% MgCl_2$ (Mg + Al) were investigated. Solid Mg was used as the reference electrode. Measurements were carried out in a argon atmosphere. The electromotive force was measured for each composition at 6-12 different temperatures, between the "liquidus" and 650°C. The Mg-Al system shows very small deviations from the ideal. The highest value of ΔF is - 140 cal/mole. The heat of mixing is negative and its highest value is - 400 cal/mole for a composition displaced toward aluminium. The entropies of mixing of liquid Mg and Al are close to the ideal values. There are 6 figures and 1 table.

Investigation and development of diesel engines (Issledovaniye i dovo-
ka dizeley) Moscow, Izd-vo "Mashinostroyeniye", 66. 167 p. illus.,
biblio. 2,000 copies printed.

TOPIC TAGS: diesel engine, diesel engine design, power plant, mechan-
ical engineering/ SMD-14 diesel

PURPOSE AND COVERAGE: This book is intended for engineering and tech-
nical personnel engaged in the design, testing, and operation of die-
sel engines. The experience of the design staff in developing and
modifying the most popular Soviet diesel engine, the SMD-14, is pre-
sented. The operation of the diesel engine, and the resulting loads,
stresses, and vibrations in it and its components, are analysed, par-
ticularly from the viewpoint of durability. Common defects found in
diesel engines and methods of eliminating them are treated in detail.
Prospects for increasing the power and economy of diesel engines are
examined. There are 23 references, 21 of which are Soviet.

Title : Results of improving quality of medical service to population

Periodical : Sov. zdrav., 1, 25-29, Jan-Feb 1955

Abstract : The merger of hospitals with outpatient clinics, effected in 1950, and adherence to medical district principle, produced a streamlined system of health service for the population of the city of Simferopol' and provided an opportunity for medical district physicians to improve their qualifications. It was found, however, that the work load of physicians assigned to outpatient clinics and visitation work in the homes of patients was much greater than the work load of physicians on duty in hospitals. A new work schedule was drawn up whereby a few physicians were detached from duty in hospitals and assigned to outpatient clinics. Conditions in outpatient clinics were thereby alleviated and expansion of preventive measures was made possible.

TITLE: A modification of the group operation of reference to the accumulator on punched tape in the "Ural-2" computer

SOURCE: Byulleten' tekhniko-ekonomicheskoy informatsii, no. 9, 1965, 27-28

TOPIC TAGS: punched paper tape, computer programming, computer technology, *COMPUTER CIRCUIT*

ABSTRACT: A system has been developed in the computing department of the Scientific Research Institute of Mining, Krivoy Rog (Nauchno-issledovatel'skiy gornorudnyy institut) for executing group operation L_p on the "Ural-2" computer, together with an algorithm in which group operation L_p is terminated by a symbol indicating the end of the block of numbers in the zone. This symbol is punched into the tape simultaneously with the input data. The number of symbols in a zone is automatically counted on a cyclic counter during data input. A diagram of the circuit for carrying out the altered system for group operation is given (Fig. 1). Use of the former algorithm for executing group operation L_p is not prevented by the alterations

TITLE: Automatic apparatus to create reversible and controllable hypothermia for possible use in space flight 2

SOURCE: AN SSSR. Otdeleniye biologicheskikh nauk. Problemy kosmicheskoy biologii, v. 4, 1965, 573-580

TOPIC TAGS: cybernetics, hypothermia, space physiology, physiologic parameter, space flight

ABSTRACT: The authors designed and tested an apparatus consisting mainly of a set of sensors² of physiological functions and a logical device to process the readings of the sensors and to issue the appropriate commands for heating or cooling should the established parameters (e. g., rectal temperature, skin temperature, depth of respiration, arterial pressure, motor activity) be exceeded. The apparatus functioned very efficiently in experiments on 16 dogs with a body temperature of 22-

L 17003-66
ACC NR: AT6003893

-25°C. The apparatus cooled the body to the prescribed level, maintained the desired level of hypothermia and state of anesthesia for up to 24 hours, and restored normal body temperature. The authors recommend a continuation of research with a view to perfecting the sensing elements, increasing the amount of information to be processed (brain and heart biopotentials), and providing the logical and control system with means of self-instruction and self-organization. 160
TITLE: Cybernetic regulation of the process of reversible hypothermia 2

SOURCE: AN SSSR. Doklady*, v. 151, no. 3, 1963, 714-717

TOPIC TAGS: cybernetic regulation, reversible hypothermia, hypothermia

ABSTRACT: An automatic device for subjecting the anesthetized organism to profound and reversible hypothermia is described. Special sensors record the various physiological parameters measures (rectal and skin temperature, respiration, arterial pressure, motor activity) and convert them into electrical impulses. Delivery of a signal (1) means that a given parameter is not within the optimal range; absence of a signal (0), that it is. Various combinations of (1) and (0) indicate whether the status of the anesthetized organism is satisfactory or requires external warming or further cooling. The design of the machine and methods for programming and regulating the temperature and the supply of the gasacus mixture are illustrated in diagrams and formulae. The apparatus has functioned successfully and safely in 46 experiments on hypothermia in dogs. It is planned to add

Card 1/2

L 14347-63

ACCESSION NR: AP3003865

bioelectric signals of brain and heart activity and a logical control system for self-instruction and self-regulation. "The construction, assembling, and adjustment of the first variant of the automatic device was done by V. I. Privezentsev and V. I. Pashinov; in the case of the second variant, by S. A. Krasil'nikov, O. Yu. Lysenko, and V. F. Matsate." Orig. art. has: 3 tables, 3 figures, 2 formulae.
